

Information

Every effort has been made to provide up to date factual information but, as our policy is one of continual improvements, we reserve the right to modify or change specifications as necessary.

All sizes where quoted are approximate and in millimetres. Products have been measured to maximum exterior dimensions including roof overhang unless otherwise stated.

Guarantee

All guarantees are conditional. If you require further information on terms and conditions, please feel free to contact us.

Full terms and conditions are supplied with every building.

Timber Buildings

All timber garden buildings are manufactured to the highest possible standards. Shiplap & Loglap buildings are guaranteed for 10 years against rot.

Building Treatment

- Shiplap and loglap buildings are dipped in a honey brown finish but this is only a preparatory treatment. To validate the guarantee, the building must be properly treated with a recognised external wood preserver within 3 months of assembly and re-treated annually thereafter. The building must also be erected on treated wooden or similar bearers (These are not always supplied with the kits.) Ground contact must be avoided.
- Baltic buildings are supplied untreated and must be treated with a recognised external wood preserver immediately after assembly.

Some specifications may vary due to availability and product improvements. Colour has been applied to some products for photographic purposes only. We take great care in the photographic accuracy of products shown in our brochure. However, due to variables in both the photographic and printing processes and the natural characteristics of wood, colours may not exactly match actual products.

Ground Contact Products

All pressure treated ground contact products are guaranteed for 15 years against rot.

Dipped Fence Panels and Trellis

All dipped fence and trellis panels are guaranteed for 15 years against rot provided they are erected on gravel boards to avoid ground contact and are treated annually with a recognised external wood preserver.

Timber Information

As timber is a natural material, there are certain weather conditions that may affect the material properties. In times of excessive dry spells the material may lose some of its internal moisture causing a certain degree of shrinking on a panel and in periods of excessive rain there will be a certain amount of swelling throughout the wooden panels. This process can not be avoided. If you have problems with certain boards shrinking in dry spells try to decrease the amount of direct sunlight on the building or the amount of air passing over the building. During hot spells spray water directly onto the panels with the aid of a garden hose.
